On Going Progress:

Alim Ul Karim: I have managed to complete the main function of all, which can solve any between number values from an expression. Now, I have `very_number` function, which I can use to determine if it is a number or an expression, if not a number then it must be an expression. Unless, it is a valid number my function will call its nested element to do things recursively.

```

CSE 115.2 Project By
Alim Ul Karim and
Alvee Ibne Rahman
-----
Project Name : Equation Solver
-----

input your equation:
    +++-+^/////13341 ++      3.14 16 + 3 / 1 * +- 2 / 4 - 3 * 2 +-+++3++++-----***
* 4 + 982 +1233 -112

Standard Format of Your Equation:
-13341+3.1416+3/1*-2/4-3*2-3-4+982+1233-112

ase:-13337.858400
s: |-13337.8584+3/1*-2/4-3*2-3-4+982+1233-112!<repalced> lIndex:0 ,rIndex:12

```

Project is now 80% done. I have tried to implement bigint but there are some issues that I could not solve. In above picture I have solved first '+' expression.

Alvee Rahman : Communication gap.
